                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention comprises nucleic acids (e.g. antisense oligonucleotides) that down regulate the expression or inhibit the function of a receptor for a neurite growth inhibitor, NOGO, prostaglandin Dz receptor (PTGDR), IkappaB kinase (IKK), or protein kinase PKR. The nucleic acids of the invention are useful for treating: cerebrovascular accident, central nervous system (CNS) injury, spinal cord injury, cancer (e.g. melanoma, lymphoma or glioma), inflammatory disease (e.g. rheumatoid arthritis, restenosis or asthma), croin's disease, diabetes, obesity, autoimmune disease, lupus, multiple sclerosis, transplant/graft rejection, ischaemia/repetusion injury, glomerulonephritis, sepsis, and allergic conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The nucleic acids of the invention are also useful for down-regulating the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Novel enzymatic nucleic acid that down-regulates expression of neurite growth inhibitor receptor, prostaglandin D2 receptor, IkappaB kinase or protein kinase PKR genes, for treating cancer and inflammatory disease.

IkappaB kinase (TKK), or protein kinase PKR. The nucleic acids of the invention are useful for treating: cerebrovascular accident, central nervous system (CNS) injury, spinal cord injury, cancer (e.g. melanoma, lymphoma or glioma), inflammatory disease (e.g. rheumatoid arthritis, restenosis or asthma), Crohn's disease, diabetes, obesity, autoimmune disease, lupus, multiple sclerosis, transplant/graft rejection, ischaemialyreperfusion injury, glomerulonephritis, sepsis, and allergic conditions (e.g. asthma, allergic thinitis or atopic dermatitis). The nucleic acids of the invention are also useful for down-regulating the
expression of a target gene and as a diagnostic tool to examine genetic drifts and mutations within diseased cells or to detect the presence of target RNA in a cell. The present RNA sequence represents a human PKR
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     antisense oligonucleotide; neurite growth inhibitor; NOGO; prostaglandin D2 receptor; PTGDR; IkappaB kinase; IKK; protein kinase PKR; cerebrovascular accident; central nervous system injury; CNS injury; spinal cord injury; cancer; melanoma; lymphoma; glioma; inflammatory disease; rheumatoid arthritis; restenosis; asthma; Crohn's disease; diabetes; obesity; autoimmune disease; lupus; multiple sclerosis; transplant rejection;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention comprises nucleic acids (e.g. antisense oligonucleotides) that down regulate the expression or inhibit the function of a receptor for a neurite growth inhibitor, NOGO, prostaglandin D2 receptor (PTGDR). IkapaB kinase (IKK), or protein kinase PKR. The nucleic acids of the invention are useful for treating: cerebrovascular accident, central nervous system (CNS) injury, spinal cord injury, cancer (e.g. melanoma, lymphoma or glioma), inflammatory disease (e.g. rheumatoid arthritis, restenosis or asthma), Crohn's disease, diabetes, obesity, autoimmune disease, lupus, multiple sclerosis, transplant/graft rejection, ischaemialyreperfusion injury, glomerulonephritis, sepsis, and allergic conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The nucleic acids of the invention are also useful for down-regulating the
expression of a target gene and as a diagnostic tool to examine genetic drifts and mutations within diseased cells or to detect the presence of target RNA in a cell. The present RNA sequence represents a human NOGO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              antisense oligonucleotide; neurite growth inhibitor; NOGO; prostaglandin D2 receptor; PTGDR; IkappaB kinase; IKK; protein kinase PKR; cerebrovascular accident; central nervous system injury; CNS injury; spinal cord injury; cancer; melanoma; lymphoma; glioma; inflammatory disease; rheumatoid arthritis; restenosis; asthma; Crohn's disease; diabetes; obeaity; autoimmune disease; lupus; multiple sclerosis; transplant rejection; graft rejection; ischaemia; reperfusion; glomerulonephritis; sepsis; allergy; asthma; allergic rhinitis; atopic dermatitis; Human IKK-gamma;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Novel enzymatic nucleic acid that down-regulates expression of neurite growth inhibitor receptor, prostaglandin D2 receptor, IkappaB kinase or protein kinase PKR genes, for treating cancer and inflammatory disease.
                                                                                                                                                                                Gaps
                                                                                                                                                                              ·.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Fosnaugh K;

Enzymatic nucleic acid molecules which specifically cleave RNA derived from hepatitis C virus (HCV), useful for the treatment of HCV infections,
expression of a target gene and as a diagnostic tool to examine genetic drifts and mutations within diseased cells or to detect the presence of target RNA in a cell. The present RNA sequence represents a human PKR
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to an enzymatic nucleic acid molecule which specifically cleaves RNA derived from hepatitis C virus (HCV), in which the binding arms of the enzymatic nucleic acid molecule comprises sequences complementary to any of the defined substrate sequences given in the specification. The nucleic acid molecule may be administered for the treatment of HCV infections, especially in combination with type I interferons. The present sequence represents a HCV DNAzyme substrate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ss; enzymatic nucleic acid; RNA cleavage; hepatitis C virus; HCV; HCV infection; type I interferon; DNAzyme.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                       ·.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Score 13.8; DB 1; Length 17;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to an enzymatic nucleic acid molecule which specifically cleaves RNA derived from hepatitis C virus (HCV), in which the binding arms of the enzymatic nucleic acid molecule comprises sequences complementary to any of the defined substrate sequences given in the specification. The nucleic acid molecule may be administered for the treatment of HCV infections, especially in combination with type I interferons. The present sequence represents a HCV DNAzyme substrate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

The invention relates to a novel method for identifying a subject at risk of breast cancer comprising detecting the presence or absence of one or more polymorphic variations associated with breast cancer in a nucleic acid sample from a subject. The method of the invention has cytostatic applications and may be useful for identifying a subject at risk of breast cancer, for early diagnosis, prevention and treatment of breast cancer, possibly via gene therapy, as well as to analyse and predict a response to a breast cancer treatment and in clinical drug trials. The current sequence is that of an Extend primer (also described as probe) of the invention which was used to genotype human intercellular adhesion molecule ICAM-4/ICAM-5 gDNA. ICAM-1 (human rhinovirus receptor; BB2 (CD54;cell surface glycoprotent) P3.58) has been mapped to chromosomal position 19p13.2- (TOM-4 (Landsteiner-Wiener blood group;IW) has · 0 Identifying a subject at risk of breast cancer by detecting the presence of polymorphic variations in the ICAM, MAPKIO, KIAA0861, NUMA1 or GALE regions which are associated with breast cancer in a nucleic acid sample CD54; cell surface glycoprotein P3.58; ICAM-4; Landsteiner-Wiener blood group; ICAM-5; telencephalin; chromosome 19pl3; ss; primer; PCR; SNP; single nucleotide polymorphism; probe. AAT11971-84 are antisense oligonucleotides (ONS) against human cytomegalovirus (CMV) that displayed activities of at least 50 % of control (ISIS 2922 shown in AAT11961). It was found that up to 4 internal mismatches could be tolerated without loss of antiviral activity. Antisense ONS targeting CMV DNA or RNA coding for the IB1, IE2 or DNA polymerase proteins have been shown to be effective in therapy, prophylaxis and diagnosis of CMV infection. The ONS may be modified to reduce nuclease resistance and to increase their efficacy. Modifications include phosphorothioate backbones, alkyl and halogen substituted sugar field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New oligo-nucleotide inhibits cytomegalovirus replication - by binding to a portion of cytomegalovirus RNA, for the diagnosis, prophylaxis and treatment of CMV diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       antisense; cytomegalovirus; CMV; human; therapy; prophylaxis; diagnosis; intermediate early complex; IE1; IE2; DNA polymerase gene; ss.
                                                                           Oligomer hybridises to the transactivating protein region of the HSV genome blocking successful replication. Useful in prevention and treatment of infected cells

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    antisense molecules. The oligonucleotides are used in modulating the function of nucleic acid molecules encoding G-alpha-12, ultimately modulating the amount of G-alpha-12 produced. The antisense compounds can be utilized for diagnostics, therapeutics, prophylaxis and as research agents and kits. They may be useful in the treatment of cancer, and
                                                                                                                                                                                                                                                                                                             a human G-alpha-12 antisense nucleotide sequence. G-alpha-12 is a
                                                                                                                                                                                                                                                                                                                               member of the G12/13 subfamily of G-proteins. The primary function of G-alpha-12 is in cell differentiation and growth. The invention relates to antisense compounds which are 8-30 noucleotides long (see AA257668-25746). The antisense molecules are targeted to the human G-alpha-12 nucleic acid molecule, and inhibit the expression of G-alpha-12. The molecules preferably have a modified internucleotide linkage, and at least one modified sugar moiety. The compounds target different regions of the human G-alpha-12 RNA. The expression of human G-alpha-12 is inhibited by contacting human cells or tissues in vitro with the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Herpes simplex virus; HSV; herpes; transactivating protein; TAP; ss.

DNA (SEDNA) to produce antisense-type gene regulation moieties. Hence they may be used therapeutically for modulating cytomegalovirus and papillomavirus processes and also as diagnostics (e.g., as probes for specific mRNAs). PNA oligomers have high affinity for complementary single stranded DNA. They are also able to form triple helices in which a first PNA strand binds with RNA or ssDNA and a second PNA strand binds with RNA or ssDNA and a second PNA strand binds with the resulting double helix or with the first PNA strand. The PNAs possess no significant charge and are water soluble, which facilitates collular upcake. Futher, since they contain amides of non-biological amino acids, they are biostable and resistant to enzymatic degradation by proceases. The present sequence targets CNV IEZ nuclear localisation ς, New oligomers are claimed which (A) have at least one peptide nucleic acid (PNA) subunit and (B) have a sequence hybridisable to AUG region, untranslated region, intron/exon (I/E) junction or coding sequence of cytomegalovirus gene selected from DNA polymerase, IEI and IE2, or hybridisable to the E, E2, E4, E5, E6, E7, L1 or L2 reading frames of a papillomavirus. The PNAs can be used to target RNA and single stranded signal 2

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention describes nucleic acid molecules which modulate the synthesis, expression and/or stability of a mRNA encoding 1 or more receptors of vascular endothelial growth factor (VEGF). A patient (preferably human) having a growth factor (VEGF). A patient fms-like tyrosine kinase 1 (f1t-1), kinase insert domain containing receptor (KDR) and/or foetal liver kinase 1 (f1k-1) (e.g. tumour anglogenesis, coular diseases, postriasis and rheumatoid arthritis) can be treated by administering the nucleic acid molecule or the expression vector to the patient. AAX67275 to AAX75752 represent specific examples of nucleic acid molecules from the present invention

first and second samples of components for an assay for complex formation between CP2 and a CPRE in the human IL4 promoter and causing the first sample of components to react in the assay, where the extent of complex formation between CP2 and a CPRE in the human IL4 promoter in the first assay sample is determined. A candidate affector is added to the second sample of components which is then caused to react in the assay, and the extent of complex formation between CP2 and a CPRE in the human IL4 promoter in the second assay sample is determined. The extent of complex formation between CP2 and a CPRE in the human IL4 promoter in the second assay sample is determined. The extent of complex formation between the two assay samples is compared to determine the effect of the candidate affector. The therapeutic composition comprising the affector is used for the interruption or enhancement of CP2 activity and thus regulation of Th1/Th2 cell balance, for therapeutic control of the immune response and immunological disease in a variety of conditions
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequences shown in AAV53107 to AAV53114 represent oligonucleotides homologous to the CP2 recognition element (CPRE) region and can interfere with CP27 CPRE interaction. These oligonucleotides are inhibitors of CP2 function and can be used in a therapeutic composition of the invention. A method of screening for such a CP2 function affector comprises providing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         including allergic rhinitis, allergic conjunctivitis, asthma, dermatitis, urticaria, multiple sclerosis, type I diabbetes mellitus, arthritis and parasitic infection. CP2 or dominant negative CP2 may also be useful in the management of immunodeficient disorders or malignancies by amplifying

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          d
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Primers AAV47637 and AAV47638 were used to amplify the wildtype VEGF-B allele from tail DNA from F2 offspring, and can be located to exon 3 and exon 4 of the mouses VEGF-B gene. F2 mice that contain the wild-type allele were found to produce an amplified fragment of 316 bp upon PCR with these primers, however mutant alleles will not be amplified by these primers, due to most of exon 3 and all of exon 4 having been completely deleted. These mutant mice produce a non-functional protein because the deletion removes 7 out of the 8 cysteine residues, thus disrupting intramolecular disulphide bonds. The transgenic animals can be used in elucidating the effects of VEGF-B on physiological phenomena such as permeability, inflammation and/or tissue repair. (Updated on 25-MAR-2003 to correct PI field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö

Antisense oligonucleotides (AAX17861-X17924) are targeted to a nucleic acid (AAX17925-X17948) encoding IE (immediate early) 1 or 2, or DNA polymerase of cytomegalovirus (CMV) and are able to inhibit CMV replication. Optionally the oligonucleotides include at least one 2'-(2-methoxy) sugar modification or phosphorothicate internucleotide linkages. The oligonucleotides are used to inhibit CMV infections (by in vivo or in vitro contact with cells, tissues or body fluids), especially
                                                                                                                                                                                                                                                                                                                                        New antisense oligonucleotides that target cytomegalovirus nucleic acid particularly including 2-methoxyethoxy sugar modifications, especially for treating viral retinitis, with long-lasting retention in the retina.
           Antisense; oligonucleotide; immediate early; DNA polymerase; CMV; cytomegalovirus; inhibition; replication; sugar modification; phosphorothioate; infection; retinitis; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human G-alpha-11 phosphorothioate antisense oligonucleotide #33

the expression of a target nucleic acid (tNA) sequence via binding of the compounds with the tNA sequence. The method comprises generating a library of virtual compounds in silico according to defined criteria, and evaluating in silico the binding of the virtual compounds with the tNA according to defined criteria. Also described are: (1) a method of according to defined criteria. Also described are: (1) a method of cating a set of oligonucleotides (ONS) that modulate the expression of a tNA sequence via binding of the ONS with the tNA sequence comprising generating a library of virtual compounds in silico according to defined criteria, and evaluating in silico the binding of the virtual ONS with the tNA according to defined criteria; and (2) a method of defining a set of compounds that modulate the expression of a tNA sequence via binding of the compounds with the tNA. The methods can be used for the generation and identification of synthetic compounds having defined physical, chemical or bioactive properties. Information gathered from assays of such compounds is used to identify nucleic acid sequences that are compounds is used to identify nucleic acid sequences that are compounds is used to identify nucleic acid sequences that are compounds is used to identify nucleic acid sequences that are compounds acriterials and secure and identify nucleic acid sequences that are antisense drug discovery and target validation. The present sequence represents a PCR primer for Herg-3, a human erg subfamily of potassium ion channel protein. The erg genes encode potassium ion channel proteins. These proteins are implicated in the development of long Q-T syndrome, a rare, but often fatal, cardiac arrhythmia. The Herg-2 and 3 proteins can be used to identify modulators of the proteins, useful in therapeutics. The nucleic acids can be used for screening of homologues
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human G-alpha-11 phosphorothioate antisense oligonucleotide SEQ ID NO:40.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention describes inhibitory antisense compounds of 8-30 nucleotides, targeted to a nucleic acid molecule encoding human G-alpha-11. AAZ19468 to AAZ19547 represent human G-alpha-11 phosphorothioate antisense oligonucleotides given in the present invention. The oligonucleotides may be useful for the treatment of diseases associated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human; G-alpha-11; antisense oligonucleotide; inhibition; expression;
                                                                                                                                                                                                                                                              Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Novel ion channel genes and proteins useful for identifying homologues and screening for therapeutics.
                                                                                                                                                                                                                                                                                                                       invention. (I) are 8 to 30 nucleotides in length and inhibit the expression of human Inhibitor-kappa B kinase-beta (IKB-beta). (I) inhibits the expression of human IKB-beta which plays a role in the development of T-cell leukaemia and in the activation of inflammatory responses. (I) is therefore useful for treating inflammatory diseases disorders with an inflammatory component such as asthma, juvenile diabetes mellitus, Graves' disease, rheumatoid arthritis, allograft
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                               PCR primers AAA74956-57 were used to amplify a 316 bp fragment from exons 3 and 4 of the VEGF (vascular endothelial growth factor)-B. The primers were used to analyse VEGF-B defficient transgenic mice. VEGF-B deficient animals show heart abnormalities that appear to be caused by atrioventricular conduction defects and ischemia of the myocardium. The specification describes methods for screening a compound for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              atriorentricular conduction or ischemia modulating activity. The method comprises introducing the compound into a VEGF-B deficient non-human animal, and assaying the effect on atrioventricular conduction or ischemia. The methods are used for screening atrioventricular conduction or ischemia modulating compounds, treatment or alledviation of these conditions, diagnosis of heart disease characterized by loss of VEGF-B expression, and detecting or diagnosing VEGF-B deficiency in heart of a
                                                                                                                                VEGF-B; vascular endothelial growth factor-B; heart abnormality; ischemia; atrioventricular conduction defect; myocardium; heart disease;
                                                                                                                                                                                                                                                                                                                                                                                                 Use of vascular endothelial growth factor B deficient animals for screening atrioventricular conduction or ischemia modulating compounds, and characterization of the biological roles of the growth factor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                        PCR primer used to amplify a 316 bp fragment of murine VEGF-B gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     G-alpha-i2; antisense inhibitor; infection; inflammation; prevent;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             G-alpha-i2 antisense inhibitor oligonucleotide #33 (ISIS #25844).

This sequence represents an antisense oligonucleotide sequence targeted nember of the Gi subfamily of G proteins, which is involved in hormonal inhibition of adenylyl cyclase and in her regulation of plasma membrane enzymes. The expression of G-alpha-i2 has been shown to be altered in some tumnours. Mice lacking the G-alpha-i2 gene display growth retardation and develop adenocarcinoma of the colon and a form of lethal diffuse coliiis similar to ulcerative colitis in humans. The antisense molecules are useful for inhibiting the expression of G-alpha-i2 in human cells or itssues, and for treating and preventing various disorders such as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Ribozyme; hairpin; hammerhead; gene therapy; vasotropic; restenosis; ss.
                                                                                                                                                                                                                                                                                                                                                     Novel antisense oligonucleotide containing compounds, useful for inhibiting the expression of G-alpha-i2 in human cells and tissues and treating infection, inflammation and cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    infection, inflammation and tumour formation. The antisense oligonucleotides are also useful for research and diagnostic purposes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This is a human G-alpha-12 antisense nucleotide sequence. G-alpha-12 is a member of the G12/13 subfamily of G-proteins. The primary function of G-alpha-12 is in cell differentiation and growth. The invention relates to antisense compounds which are 8-30 nucleotides long (see AAZ57668-Z57746). The antisense molecules are targeted to the human G-alpha-12 mucleic acid molecules, and inhibit the expression of G-alpha-12. The molecules preferably have a modified internucleotide linkage, and at least one modified sugar moiety. The compounds target different regions of the human G-alpha-12 RNA. The expression of human G-alpha-12 inhibited by contacting human cells or tissues in vitro with the antisense molecules. The oligonucleotides are used in modulating the
                                                                                                                                                                                                                                                                         ņ
                                                                                                                                                                               designed to cleave RNA encoding a cyclin or cell-cycle dependent kinase other than cell-cycle dependent kinases CDK1, PCNA and Cyclin B1. Representative examples of ribozyme recognition sites are given in AAA82215 to AAA86787. The ribozyme of the invention is useful for inhibiting restenosis by introduction of the ribozyme into cells. The ribozyme is resistant to endonuclease activity and hence is efficient in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 G-alpha-12 inhibitor; antisense compound; cell differentiation; cancer; cell growth; metastatic growth; ss; ISIS# 20657.
                                             New hairpin and hammerhead ribozyme for inhibiting restenosis, cleaves RNA encoding a cyclin or cell-cycle dependent kinase other than CDKI, PCNA and Cyclin B1.
                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                The present invention relates to a hairpin or hammerhead ribozyme.
                                                                                                                                                                                                                                                                                                                                                                                                         .

part of an Escherichia coli figgellin protein except a protein expressed by E. coli H., H7, H12 or H48 type strains. The present invention also describes a method of detecting the presence of E. coli of a particular H serotype in a sample, comprising specifically hybridishing a nucleic acid, preferably at least a pair, derived from a flagellating gene, specific for a particular flagellin gene associated with the H serotype, to any coli in the sample which contain the gene, and detecting any hybridised molecules, identifying the presence of that serotype in the sample. (I) are useful for: (I) detecting the presence of E. coli of H serotype in a sample by hybridishing at least one or a pair of (I) to any E. coli in the sample and detecting the presence of E. coli by Coli in the sample and detecting the hybridised nucleic acid molecules; and (2) for detecting the presence of B. coli by the hybridishing at least one or a pair of (I) to any E. coli by hybridishing at least one or a pair of (I) to any E. coli by the sample and detecting the hybridised nucleic acid molecules; and (2) for sample and detecting the hybridised nucleic acid molecules. (I) is

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                particularly useful for detecting the combination of 0 and H antigen. Hybridised (I) when using at least one (I) is detected by southern blot analysis and, when using a pair of (I), is detected by polymerase chain reaction (PCR). AAZ56399 to AAZ56420 represent primers used in the
function of nucleic acid molecules encoding G-alpha-12, ultimately modulating the amount of G-alpha-12 produced. The antisense compounds obe utilized for diagnostics, therapeutics, prophylaxis and as research agents and kits. They may be useful in the treatment of cancer, and metastatic growth

The present invention relates to use of a DNA fragment comprising a sequence of 86 nucleotides fully defined in the specification, or its functional analogs, for regulating the expression of a gene that induces parthenocarpy in a plant, by inserting the fragment at the 5' end transcribed untranslated region of the gene. The invention is useful for transgenic plant production which do not show any malformations caused by the use of gene Deff9-iaaM in some species and cultivars, and for regulating the gene that induces parthenocarpy in a plant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Use of DNA fragment of specified length to modulate the expression of genes that induce the parthenocarpic trait in plants, by inserting the DNA fragment at the 5' end transcribed untranslated region of the gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Score 13.8; DB 1; Length 18;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Novel antisense compounds useful for inhibiting the expression of human 3-phosphoinositide dependent protein kinase-1, useful e.g. for treating inflammation, tumors and infections.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present sequence is one of a large number of antisense oligonucleotides which are targeted to a nucleic acid molecule encoding human 3-phosphoinositide dependent protein kinase 1 (PDK-1). The antisense compounds may be oligodeoxynucleotides or chimeric oligonucleotides, which is flanked on both sides by 2'-methoxyethyl (2'-MoDE) wings. The oligonucleotides have a phosphorothioate backbone. The antisense oligonucleotides are useful for inhibiting the expression of human PDK-1 in human cells or tissues. They are also useful for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             preventing or delaying infection, inflammation or tumours and are useful

is a triterpenoid responsible for paltablity to animals and resistance to pathogens and predacors. The beta-amyrin synthase encoding nucleic acid is useful for producing a transpencipality to animals and resistance to pathogens and predacors. The beta-amyrin synthase encoding nucleic acid containing it into a host cell, optionally causing or allowing recombination between the vector and the host cell genome so as to transform the host cell, and regenerating a plant from the transformed plant cell. The DNA is also useful for identifying, cloning or determining the presence of a nucleic acid in a sample and for influencing or affecting the quantity or quality of triterpenoid synthesis, preferably an oleanane type triterpene saponin synthesis, in a plant, such as altering resistance to a fungal pathogen e.g., an assonycete having a sterol-containing membrane, optionally selected from assonycete having a sterol-containing membrane, preserved from a songetted from a songette and promise transfer and promise
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                       Gaeumannomyces graminis vars tritici and avenae, Fusarium culmorus, F. avanaeceum, Stagonospora nodorum or S. avenae, taste, palatability and/or nutritional value, of the plant, by causing or allowing expression of the DNA within the cells of the plant, following an earlier step of introducing the DNA into a cell or its ancestor. The DNA is also useful for reducing the level of triterpenoids in the plant, by causing or allowing transcription from an antisense molecule in the plant, allowing transcription from the DNA, or its part such as to reduce beta-amyrin synthase expression by co-suppression, use of a nucleic acid encoding a ribozyme specific for the DNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to a purified polynucleotide (I) encoding a protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Novel human gene Otoferlin, underlying an autosomal recessive nonsyndromic prelingual deafness, DFNB9, and proteins encoded by the gene, implicated in deafness.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention relates to use of a DNA fragment comprising a sequence of 86 nucleotides fully defined in the specification, or its functional analogs, for regulating the expression of a gene that induces parthenocarpy in a plant, by inserting the fragment at the 5' end transcribed untranslated region of the gene. The invention is useful for transgenic plant production which do not show any malformations caused by the use of gene DefH9-iaam in some species and cultivars, and for regulating the gene that induces parthenocarpy in a plant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Novel beta-amyrin synthase encoding nucleic acids useful for influencing or affecting triterpene synthesis, and hence resistance to fungal pathogen, taste, palatability or nutritional value of plants.
                                                                                                                                                                                                                                                                          Use of DNA fragment of specified length to modulate the expression of genes that induce the parthenocarpic trait in plants, by inserting the DNA fragment at the 5' end transcribed untranslated region of the gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

method for monitoring expression and/or localisation of a transgene, and production of therapeutic peptide in a mammal. The method involves quantifying or detecting the amount of marker polypeptide and/or sodium iodide symporter (NIS) linked to the product of the transgene or the transgene or the transgene or the transgene or the repeating gene released from cells into extracellular body fluid, or determining the location of labelled molecules which are transported into the cells bearing the marker peptide. The method provides convenient and effective monitoring of the level and kinetics of expression of transgenes and the tissue specific distribution of expressed transgenes in cells, tissues, animals or humans without the need for disruptive and expensive sampling methods including surgery. The transgene location can be monitored without adversely affecting the mammal or the cell. The NIS is a self protein and as such does not stimulate a host immune reaction. Furthermore, the NIS functions solely to sequester iodine into a cell, which does not adversely affect normal cellular function or overall cell
                                                                                                                                                                                                                                                     ;

sequence (II) encoded by a novel human gene, otoferlin (OTOF) or the long human otoferlin isoform in brain. (I) was identified as underlying an autosomal nonsyndromic prelingual deafness DFNB9, and is thus useful for detecting deafness disease in humans and for characterising the functions of proteins and genes encoding them in auditory function. AAS95622-AAS95248 represent human and mouse otoferlin coding sequences, PCR
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Monitoring transgene expression and therapeutic peptide production in mammals by detecting marker polypeptides linked to transgenes or therapeutic genes released from cells into extracellular body fluid.
                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present sequence is a self-cleaving linker. It may be used in a

The present invention describes a method for treating a proliferative skin or eye disease and scarring. The method involves administering a ribozyme [1] which cleaves RNA encoding a cytckine involved in inflammation, matrix metalloproteinase (MMP), cyclin, cell-cycle dependent kinase, growth factor or a reductase, or administering a nucleic acid molecule [11] comprising a promoter operably linked to a nucleic acid molecule [11] comprising a promoter operably linked to a nucleic acid segment encoding [1]. [1] can have antipsoriatic, antisickling, charactological, cytostatic, antiseborrheic, antidiabetic, antisickling, ophthalmological, vulnerary, keratolytic and virucide activities, and cleaves RNA encoding cytokine involved in inflammation. [1] can be used in gene therapy. [1] and [11] are useful for treating proliferative skin diseases such as psoriasis, atopic dermatitis, actinic keratosis, squamous or basal cell carcinoma and viral or seborrheic wart. They can also be used for treating proliferative eye diseases such as diabetic retinopathy, vitreoretinopathy, sickle cell retinopathy, retinopathy of prematurity and retinal detachment, and for treating and preventing
                                                                                                                       ..

These sequences can be used in nutritional supplements, they may have cytokine, cell differentiation, cell proliferation, immunomodulatory, antiinflammatory, haematopoiesis regulating, tissue growth, chemotarctic, chaemokinetic, haemostatic, thrombolytic, tumour suppression, and tumour inhibition activities, and they may also be used in the treatment of infections, infertility, and cognitive and depressive disorders. The present sequence is a probe used to isolate the coding

                                              This invention describes a novel agent (A) for post-operative insertion, after removal of bone tumor, comprising a nucleic acid (NA1) encoding a growth factor, especially of the transforming growth factor superfamily, linked by an oligonuclectice (NO to a sequence (NA2) encoding a protease inhibitor (Pi). The product of the invention has osteopathic and vulnerary activity and can be used for gene therapy. (A) are used to promote regeneration of bone after surgical removal of primary or metastatic bone cancers. (A) make it possible to use less extensive surgery (removal of less bone), since it reduces the risk of new metastases arising from the borders of the resected zone. It also improves growth of bone into prostheses, resulting in shorter recovery times and stronger incorporation of the prosthesis, and reduces the need for further surgery. This sequence represents a PCR primer used in the amplification of the cystatin C gene used to illustrate the method of the

EP1176216-A2 30-JAN-2002. Nakamura K, Synthetic.

chlorinated ethylene-decomposing bacteria (e.g. Dehalococcoides) comprising the novel nucleic acid by DNA hybridisation using the labelled probe as an indicator. The bacteria can also be detected by performing PCR using the nucleic acid as a primer and the sample nucleic acid as a template, and detecting newly synthemised DNA. A method for decomposing chlorinated ethylene or ethane comprises detecting chlorinated ethylenedecomposing bacteria using underground water or soil as a sample, and introducing the water/soil containing the bacteria, to soil or underground water contaminated by chlorinated ethylene or ethane. The methods are therefore useful for purifying soil or underground water contaminated with chlorinated ethylene or ethane. This sequence represents a nucleic acid which hybridises to nucleic acid which hybridises to nucleic acid of chlorinated ethylene-decomposing bacteria The invention relates to a nucleic acid which hybridises to the 16S ribosomal (deoxy)ribonucleic acid of chlorinated ethylene-decomposing bacteria. The nucleic acid can be used as a labelled probe for detecting

New NOVX polypeptides and polynucleotides useful for treating or preventing e.g. neurodegenerative diseases, neurological disorders, cardiovascular diseases and disorders, or immunological diseases.

Example 3; Page 288; 299pp; English.

medicament for treating or preventing neurodegenerative diseases (e.g. Alzheimer's disease, Parkinson's disease, or Huntington's disease),
Alzheimer's disease, Parkinson's disease, or Huntington's disease),
neurological disorders (e.g. anxiety, schizophrenia, manic depression or mental retardation), cardiovascular diseases (e.g. acute heart failure, angina pectoris or myocardial infarction), muscular diseases and diseases (including those involving photoreception, dafaness and keratinisation disorders, inflammatory and immune diseases, bacterial, fungal, protozoal and viral infections, and reproductive compounds that modulate the NOVX protein activity or expression, as well as to treat disorders characterised by insufficient or excessive production of NOVX protein forms that have decreased or aberrant activity compared to NOVX wild type protein, such as diabetes, obseity, metabolic disturbances associated with obesity, anorexia and obesity, metabolic disturbances associated with chronic diseases and various cancers, infectious diseases associated with chronic diseases and various dyslipidaemias. The nucleic acid sequences of the invention may be used in chromosome mapping, identifying an individual from minute biological samples (tissue typing), and in The present invention relates to new NOVX polypeptides. The polypeptides, polynucleotides and antibodies are useful in the manufacture of a forensic identification of a biological sample. The present nucleic acid sequence represents a cloning PCR primer that was used in the methods of the invention for amplification of the NOVX TGF-beta binding gene

This invention describes novel oligonucleotides used in a method for detecting beer-spoilage bacteria in a sample. The bacteria detected include lattic acid bacteria of the genera Latchbacillus or Pediococcus, especially the species L. coryniformis, L. perclens, L. buchneri, L. plantarum, L. fructivorans, L. lindheri, L. casei, L. brewis or P. plantarum, or Gram-negative bacteria of the genera Pectinatus and Megasphaera, specifically P. frisingensis, P. cerevisiphilus and M. cerevisiae. The oligonucleotides of the invention provide rapid detection of spoilage bacteria (typically within 48 hours, compared with 7-12 days for conventional culture methods), can detect all relevant bacteria in parallel, can differentiate between species of the same genus, and are easy to use. ApB14806-ADB15247 represent the oligonucleotides used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New oligonucleotides, useful for rapid detection of beer-spoilage bacteria by in situ hybridization, are specific for type, genus or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            .;

                                                                                                                                                                                                                                                         ·;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention relates to human phenotype-associated (PA) genes (I A. ADF13307-ADF13386) which contain a Single Nucleotide Polymorphism (SNP). The SNP is given in the sequence as a variant nucleotide. Also claimed are methods for screening for agents which regulate the activity of a PA gene and reagents that modulate the activity of a PA polypeptide or a polymucleotide where the reagent is identified by the screening methods. The methods and compositions of the present invention are useful for prognosticating, diagnosing and treating cardiovascular diseases,
                                                                                                                                                 Leukocyte Antigen (HLA) genotype of a subject using hybridisation and amplification assay. The method is used for determining the HLA genotype of a subject. The present sequence represents a HLA class I allele
                                                                                                                                      The invention relates to a method of identifying a class I or II Human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             or

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates an isolated polynucleotide (I) encoded by a cardiovascular associated (CA) gene, having allelic variation contained in a functional surrounding like full length cDNA for CA gene polypeptide, and with or without the CA gene promoter sequence. (I) is a polynucleotide comprising single nucleotide polymorphisms predicting cardiovascular disease. The polynucleotide polymorphisms predicting predispostion or susceptibility to a cardiovascular disease, e.g. atherosclerosis, isohemia/reperfusion, hypertension, restenosis, arterial inflammation, myocardial infarction, and stroke. These may also be used to predict personal medication schemes omitting adverse drug reactions, or as probes for detecting genetic polymorphisms and as templates for the recombinant production of normal or variant peptides/polypeptides encoded by the genes. This sequence corresponds to a PCR primer to amplify one of the genes of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  SNP; single nucleotide polymorphism; cardiovascular associated gene; allelic variation; atherosclerosis; ischemia; reperfusion; hypertension; restenosis; arterial inflammation; myocardial infarction; stroke; primer;
such as atherosclerosis, hypertension, restenosis, arterial inflammation, myocardial infarction and stroke. The present sequence is a PCR primer, used in the examples from the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New isolated polynucleotides comprising single nucleotide polymorphisms of the cardiovascular gene, useful for assessing predisposition or susceptibility to a cardiovascular disease, e.g. atherosclerosis,

The invention relates to a novel method for monitoring harmful microorganisms in the paper and board industry comprising detecting the presence or absence of the harmful target microorganism by in situ hybridization using an oligonuclectide probe hybridizable with a region of a nucleic acid of the target microorganism. The method is useful for determining the need of an anti-biofilm agent in the paper or board making process, and for inhibiting the formation of agglomerates and/or biofilm, and/or removing the agglomerates and/or biofilm, and/or removing the agglomerates and/or by thermophilic microorganisms, from the surfaces of paper and board making machines. The method also enables an efficient and timesaving process for monitoring the microbiological state of a paper or board making process, and for the recognition of the microorganism before
                                                                                                                                                                                                                                                                                                                                                                       Monitoring harmful microorganisms in paper and board industry, involves detecting presence of harmful target microorganisms by in situ hybridization using oligonucleotide probe hybridizable to nucleic acid of target microorganism.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       cytomegalovirus; CMV; human, therapy; prophylaxis; diagnosis; e early complex; IE1; IE2; DNA polymerase gene; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       process failures emerge. The present sequence represents an oligonucleotide probe targeted to a region or rRNA of a target
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       0.8%; Score 13.8; DB 1; Length 18; 88.2%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             (HIA) genotype of a subject comprising: obtaining a sample comprising acid template nucleic acid from the subject; amplifying the template nucleic acid with HIA allele-specific forward primers and HIA allele-specific reverse primers to form amplification products; hybridising the amplification products with an HIA locus-specific capture oligonucleotide is and detecting the detectable complexes to identify the HIA genotype of the subject. The present sequence represents one of 276 HIA locus-specific capture oligonucleotides of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Identifying an HLA genotype of a subject by hybridizing the amplification products with an HLA locus-specific capture oligonucleotide and detecting the detectable complexes to identify the HLA genotype of the subject.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention describes a method of identifying a human leukocyte antigen

a portion of cytomegalovirus replication - by binding to a portion of cytomegalovirus RNA, for the diagnosis, prophylaxis and treatment of CMV diseases.
                                                                                                                                                                                                                                                                                                                 AATI1971-84 are antisense oligonucleotides (ONs) against human cytomegalovirus (CMV) that displayed activities of at least 50 % of control (ISIS 2922 shown in AATI1961). It was found that up to 4 internal mismatches could be tolerated without loss of antiviral activity. Antisense ONs targeting CMV DNA or RNA coding for the IEI, IE2 or DNA polymerase proteins have been shown to be effective in therapy, polymerase proteins have been shown to be effective in therapy, prophylaxis and diagnosis of CMV infection. The ONs may be modified to reduce nuclease resistance and to increase their efficacy. Modifications include phosphorothicate backbones, alkyl and halogen-substituted sugar moieties at the 2' position. (Updated on 25-MAR-2003 to correct PF
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              /*tag= a //tag= a //note= "at least one (and preferably all) of the backbone

New oligomers are claimed which (A) have at least one peptide nucleic acid (PNA) subunit and (B) have a sequence hybridisable to AUG region, 5 untranslated region, intron/exon (I/E) junction or coding sequence of cytomegalovirus gene selected from DNA polymerase, IE1 and IE2, or papillomavirus. The PNAs can be used to target RNA and single stranded DNA (ssDNA) to produce antisense type gene regulation moieties. Hence they may be used therapeutically for modulating cytomegalovirus and papillomavirus processes and also as diagnostics (e.g., as probes for specific mRNAs). PNA oligomers have high affinity for complementary single stranded DNA. They are also able to form triple helices in which a first PNA strand binds with the first PNA strand binds with the first PNA strand binds with the first PNA strand. The PNAs is possess no significant charge and are water soluble, which facilitates
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         0
                                                                                                                                                                                                                                                                                                                                                                                                                                                   possess no significant charge and are water soluble, which facilitates callular uptake. Futher, since they contain amides of non-biological amino acids, they are biostable and resistant to enzymatic degradation proteases. The present sequence targets CMV IE2 nuclear localisation

These primers can be used in a method for determining polymorphic forms in an individual for use in e.g. forensics, patermity testing or for phenotypic typing for diseases such as agammaglobulinemia, adabetes inspiduas, Lesch-Nyhan syndrome, muscular dystrophy, Wiskott-Aldrich syndrome, Rabry's disease, familial hypercholesterolemia, polycystic kidney disease, hereditary spherocytosis, von Willebrand's disease, tuberous sclerosis, hereditary haemorrhagic telangiectasia, familial colonic polyposis, Ehlers-Danlos syndrome, osteogenesis imperfecta, acute intermittent porphyria, autoimmune diseases, inflammation, cancer, disease of the nervous system, infection by pathogenic microorganisms, and characteristics such as longevity, appearance (e.g. baldness, obesity), strength, speed,
New isolated Salmonella secreted proteins and related genes - used to develop products for the detection, treatment or prevention of Salmonella
                                                                               PCR primers DP15 (AAT67043) and DP17 (AAT67044) were used to amplify a 724-bp org gene probe. The probe can be used to identify the Salmonella typhimurium oxygen-regulated gene (org)

The ITS1 sequence corresponds to the region between the 3' end of the 18S ribosomal gene and the 5' end of the 5.8S ribosomal gene. The ITS1 sequence was PCR amplified from isolated DNA from both the yeart and mycelial forms of H. capsulatum. Fragments of th sequence (e.g. AAV01568-V01574) can be used as primers and probes for H.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Internal transcribed spacer, ITS; ribosomal RNA; 185; 5.8S; ss; primer; PCR; amplification; probe; hybridisation; detection; histoplasmosis.

                                                                                                                                                                                                                                                                                                                             PCR primers AAX04626-27 were used to amplify the alpha-tubulin 4 gene. The primers are used as an internal control when determining expression of the GA4H1 gene. GA4H1 is a gibberellin 4 (GA4) homologue. The GA4H proteins (GA4H1 and GA4H2) have similar functions to GA4. GA4H is believed to be a member of the enzyme family involved in the biosynthesis of the gibberellin family of plant growth hormones that promote various growth and developmental processes in higher plants, such as seed germination, stem elongation, flowering and fruiting. GA4 is a betahydroxylase, and the homologues may also have 3-betahydroxylase activity, which is critical for controlling stem growth. GA4H may be applied to crops to enhance and facilitate stem elongation, flowering and fruiting. Alternatively, the DNA encoding GA4H may be genetically inserted into the plant host to produce a similar effect
                                                                                                                                                                                                                                    New isolated Gibberellin 4 homologues - derived from Arabidopsis plants, used to develop products for altering stem growth, e.g. for enhancing stem elongation, flowering and fruiting.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

designed to cleave RNA encoding a cyclin or cell-cycle dependent kinase other than cell-cycle dependent kinases CDK1, PCNA and Cyclin B1. Representative examples of ribozyme recognition sites are given in AAA82415 to AAA86787. The ribozyme of the invention is useful for inhibiting restenosis by introduction of the ribozyme into cells. The ribozyme is resistant to endonuclease activity and hence is efficient in restenosis treatment
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention relates to a hairpin or hammerhead ribozyme, designed to cleave RNA encoding a cyclin or cell-cycle dependent kinase other than cell-cycle dependent kinases CDK1, PCNA and Cyclin B1. Representative examples of ribozyme recognition sites are given in AAA82415 to AAA86787. The ribozyme of the invention is useful for inhibiting restenosis by introduction of the ribozyme into cells.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              à
                                                                                                                                                                                                                   coligonucleotides AAZ36562-97 represent a set of probes hybridising to the human c-exb-B-2 (HER-2) gene. The probes are used to demonstrate the method of the invention. The specification describes a method for the detection of chromosome aberrations in eukaryotic samples uses sets of peptide nucleic acid (PNA) probes in hybridisation reactions. The method comprises using at least 2 sets of hybridisation reactions. The method composities using at least 2 sets of hybridisation probes, where at least composine. The method sequences related to a potential aberration in a chromosome. The methods can be used for the detection of chromosome aberrations. They can be used for the diagnosis of disorders and diseases related to chromosomal aberrations or abnormalities such as e.g. hampoietic malignancies, cancers and inborn constituel diseases. The method may be used for detecting viral sequences and their localization in the chromosome. In plant biology, the methods can be used for monitoring the efficiency of transferring herbicide resistance genes to a

Mammalia

```
The present invention relates to a hairpin or hammerhead ribozyme, designed to cleave RNA encoding a cyclin or cell-cycle dependent kinase other than cell-cycle dependent kinases CDK1, PCNA and Cyclin B1.
Representative examples of ribozyme recognition sites are given in AAA82415 to AAA86787. The ribozyme of the invention is useful for inhibiting restenosis by introduction of the ribozyme into cells. The ribozyme is resistant to endonuclease activity and hence is efficient in restenosis treatment
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Ribozyme; hairpin; hammerhead; gene therapy; vasotropic; restenosis; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention relates to a hairpin or hammerhead ribozyme, designed to cleave RNA encoding a cyclin or cell-cycle dependent kinase other than cell-cycle dependent kinases CDK1, PCNA and Cyclin B1. Representative examples of ribozyme recognition sites are given in
                                                                                                                                                        New hairpin and hammerhead ribozyme for inhibiting restenosis, cleaves RNA encoding a cyclin or cell-cycle dependent kinase other than CDK1, PCNA and Cyclin B1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New hairpin and hammerhead ribozyme for inhibiting restenosis, cleaves RNA encoding a cyclin or cell-cycle dependent kinase other than CDK1, PCNA and Cyclin B1.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention relates to a hairpin or hammerhead ribozyme, designed to cleave RNA encoding a cyclin or cell-cycle dependent kinase other than cell-cycle dependent kinases CDK1, PCNA and Cyclin Bl.
Representative examples of ribozyme recognition sites are given in AAA82415 to AAA86787. The ribozyme of the invention is useful for inhibiting restenosis by introduction of the ribozyme into cells. The ribozyme is resistant to endonuclease activity and hence is efficient in restenosis treatment

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention relates to a hairpin or hammerhead ribozyme, designed to cleave RNA encoding a cyclin or cell-cycle dependent Kinase other than cell-cycle dependent kinases CDK1, PCNA and Cyclin B1.
Representative examples of ribozyme recognition sites are given in AAA88415 to AAA86787. The ribozyme of the invention is useful for inhibiting restenosis by introduction of the ribozyme into cells. The ribozyme is resistant to endonuclease activity and hence is efficient in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Ribozyme; hairpin; hammerhead; gene therapy; vasotropic; restenosis; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                              New hairpin and hammerhead ribozyme for inhibiting restenosis, cleaves RNA encoding a cyclin or cell-cycle dependent kinase other than CDK1, PCNA and Cyclin B1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Length 19;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                     The present invention relates to a hairpin or hammerhead ribozyme, designed to cleave RNA encoding a cyclin or cell-cycle dependent kinase other than cell-cycle dependent kinases CDK1. PCNA and Cyclin B1. Representative examples of ribozyme recognition sites are given in AAA82415 to AAA86787. The ribozyme of the invention is useful for inhibiting restenosis by introduction of the ribozyme into cells. The ribozyme is resistant to endonuclease activity and hence is efficient in restenosis treatment
                                                                                                                                                                                                                                                                                                                                                                                                                                                                    hairpin; hammerhead; gene therapy; vasotropic; restenosis; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New hairpin and hammerhead ribozyme for inhibiting restenosis, cleaves RNA encoding a cyclin or cell-cycle dependent kinase other than CDK1, PCNA and Cyclin B1.
AAA82415 to AAA86787. The ribozyme of the invention is useful for inhibiting restenosis by introduction of the ribozyme into cells. The ribozyme is resistant to endonuclease activity and hence is efficient restenosis treatment
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             à
                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                        The present invention relates to a hairpin or hammerhead ribozyme, designed to cleave RNA encoding a cyclin or cell-cycle dependent kinase other than cell-cycle dependent kinases CDK1, PCNA and Cyclin Bl. Representative examples of ribozyme recognition sites are given in AA82415 to AAA86787. The ribozyme of the invention is useful for inhibiting restenosis by introduction of the ribozyme into cells. The ribozyme is resistant to endonuclease activity and hence is efficient in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention relates to a hairpin or hammerhead ribozyme, designed to cleave RNA encoding a cyclin or cell-cycle dependent kinase other than cell-cycle dependent kinases CDKI, PCNA and Cyclin B1. Representative examples of ribozyme recognition sites are given in AAABS415 to AAAB6787. The ribozyme of the invention is useful for inhibiting restenosis by introduction of the ribozyme into cells. The ribozyme is resistant to endonuclease activity and hence is efficient in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Ribozyme; hairpin; hammerhead; gene therapy; vasotropic; restenosis; ss.
                                                               New hairpin and hammerhead ribozyme for inhibiting restenosis, cleaves RNA encoding a cyclin or cell-cycle dependent kinase other than CDKI, PCNA and Cyclin B1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          cleaves
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New hairpin and hammerhead ribozyme for inhibiting restenosis, cleave

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention provides nucleotides encoding molecular variants of the human multi drug resistance-1 (MDR-1) protein. These can be used to identify compounds capable of treating multidrug resistance and sensitivity interfering resulting from polymorphisms in MDR-1, which can lead to difficulties in treating cancer, cardiovascular, neuronal, inflammatory and CNS diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New polynucleotide encoding a molecular variant Multi Drug Resistance (MDR)-1 polypeptide is useful for diagnosing and treating diseases associated with abnormal MDR-1 expression or function, e.g. cancer.
                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

                                                                                                                                                                                                                                                                                                                                                                     The present invention provides nucleotides encoding molecular variants of the human multi drug resistance-1 (MDR-1) protein. These can be used to identify compounds capable of treating multidrug resistance and sensitivity interfering resulting from polymorphisms in MDR-1, which can lead to difficulties in treating cancer, cardiovascular, neuronal, inflammatory and CNS diseases
                                                                                                                                                                                                                                                                                                    New polynucleotide encoding a molecular variant Multi Drug Resistance (MDR)-1 polypeptide is useful for diagnosing and treating diseases associated with abnormal MDR-1 expression or function, e.g. cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

The present invention describes a method for treating a proliferative skin or eye disease and scarring. The method involves administering a ribozyme [1] which cleaves RNA encoding a cytokine involved in inflammation, matrix metalloproteinase (MMP), cyclin, cell-cycle dependent kinase, growth factor or a reductase, or administering a nucleic acid modecule [11] comprising a promoter operably linked to a nucleic acid segment encoding [12]. [1] can have antipsoriatic, dermatological, cytostatic, antiseborrheic, antidiabetic, antisickling, cleaves RNA encoding cytokine involved in inflammation. [1] can be used in gene therapy. [1] and [11] are useful for treating proliferative skin diseases such as psoriasis, atopic dermatitis, actinic keratosis, squamous or basal cell carcinoma and viral or seborrheic wart. They can also be used for treating proliferative eye diseases such as diabetic retinopathy, vitreoretinopathy, sickle cell retinopathy, retinopathy of prematurity and retinal decachment, and for treating and preventing content scarring such as keloid, adhesion and hypertrophic or hypertrophic burn scar.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention describes a method for treating a proliferative skin or eye disease and scarring. The method involves administering a ribozyme (I) which cleaves RNA encoding a cytokine involved in inflammation, matrix metalloproteinase (MMP). cyclin, cell-cycle dependent kinase, growth factor or a reductase, or administering a nucleic acid molecule (II) comprising a promoter operably linked to a nucleic acid molecule (II) comprising a promoter operably linked to a nucleic acid molecule (II) comprising a promoter operably linked to a nucleic acid molecule (II) comprising a promoter operably linked to a nucleic acid molecule (II) comprising a promoter operably linked to a nucleic acid molecule (II) ace useful for treating proliferative skin diseases such as psoriasis, atopic dermatitis, actinic keratosis, squamous or basal cell carcinoma and viral or seborrheic wart. They can also be used for treating proliferative eye diseases such as diabetic retinopathy, vitreoretinopathy, sickle cell retinopathy, retinopathy of prematurity and retinal detachment, and for treating and preventing scarring such as kelloid, adhesion and hypertrophic or hypertrophic burn
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   .

The present invention describes a method for treating a proliferative skin or eye disease and scarring. The method involves administering a ribozyme [1] which cleaves RNA encoding a cytokine involved in inflammation, matrix metalloproteinase (MMP), cyclin, cell-cycle dependent kinase, growth factor or a reductase, or administering a nucleic acid molecule [11] comprising a promoter operably linked to a concleic acid segment encoding [1]. [1] can have antiposoriatic, dermatological, cytostatic, antiseborrheic, antidiabetic, antisickling, ophthalmological, vulnerary, keratolytic and virucide activities, and cleaves RNA encoding cytokine involved in inflammation. [1] can be used in gene therapy. [1] and [11] are useful for treating proliferative skin diseases such as psoriasis, atopic dermatitis, actinic keratosis, suppose the control of treating proliferative eye diseases such as diabetic retinopathy, vitreoretinogathy, sickle cell retinopathy, retinopathy of prematurity and retinal detechment, and for treating and preventing proliferative of the diseases such as diabetic prematurity and retinal detechment, and for treating and preventing proliferative of the diseases and activities.
                                                                                                                                                                                                                                                                                                                                                            Treating proliferative skin or eye diseases and scarring, using ribozymes that cleave RNA encoding cytokines involved in inflammation, matrix metalloproteinases, growth factors and cell-cycle dependent kinases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human; ribozyme therapy; hairpin ribozyme; hammerhead ribozyme; recognition site; target; ribozyme binding site; eye disease; vulnerary; proliferative disease; skin disease; psoriasis; diabetic retinopathy; cytokine; inflammation; cell-cycle dependent kinase; cyclin; MMP; matrix metalloproteinase; growth factor; reductase; scarring; cytostatic; antipsoriatic; dermatological; antiseborrheic; antidiabetic; virucide; antisickling; ophthalmological; keratolytic; gene therapy; viral wart;

The present invention describes a method for treating a proliferative skin or eye disease and scarring. The method involves administering a ribozyme [1] which cleaves RNA encoding a cytokine involved in inflammation, matrix metalloproteinase (MMP), cyclin, cell-cycle dependent kinase, growth factor or a reductase, or administering a nucleic acid molecule [II] comprising a promote operably linked to a concleic acid segment encoding [1]. [1] can have antipsoriatic, dermatological, cytostatic, antiseborrheic, antidiabetic, antisickling, ophthalmological, vulnerary, keratolytic and virucide activities, and cleaves RNA encoding cytokine involved in inflammation. [1] can be used in gene therapy. [1] and [II] are useful for treating proliferative skin diseases such as psoriasis, atopic dermatitis, actinic keratosis, squamous or basal cell carcinoma and viral or seborrheic wart. They can also be used for treating proliferative eye diseases such as diabetic retinopathy, vitreoretinopathy, sickle cell retinopathy, retinopathy of prematurity and retinal detechment, and for treating and preventing.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Treating proliferative skin or eye diseases and scarring, using ribozymes that cleave RNA encoding cytokines involved in inflammation, matrix metalloproteinases, growth factors and cell-cycle dependent kinases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human, ribozyme therapy, hairpin ribozyme, hammerhead ribozyme,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention describes a method for treating a proliferative skin or eye disease and scarring. The method involves administering a ribozyme [1] which cleaves RNA encoding a cytckine involved in inflammation, matrix metalloproteinase (MMP), cyclin, cell-cycle dependent kinase, growth factor or a reductase, or administering a nucleic acid molecule [II] comprising a promoter operably linked to a nucleic acid segment encoding [1]. [1] can have antiposriatic, antisickling, dermatological, cytostatic, antiseborrheic, antidabetic, antisickling, ophthalmological, vulnerary, keratolytic and virucide activities, and cleaves RNA encoding CVI in real useful for treating proliferative skin diseases such as psoriasis, atopic dermatitis, actinic keratosis, signal and be used for treating proliferative eye diseases such as diabetic retinopathy, vitreoretinopathy, sickle cell retinopathy, retinopathy of prematurity and retinial detechment, and for treating and preventing profile treating and preventing and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Treating proliferative skin or eye diseases and scarring, using ribozymes that cleave RNA encoding cytokines involved in inflammation, matrix metalloproteinases, growth factors and cell-cycle dependent kinases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human; ribozyme therapy; hairpin ribozyme; hammerhead ribozyme; recognition site; target; ribozyme binding site; eye disease; vulnerary; proliferative disease; skin disease; psoriasis; diabetic retinopathy; cytokine; inflammation; cell-cycle dependent kinase; cyclin; MMP; matrix metalloproteinase; growth factor; reductase; scarring; cytostatic;

```
The present invention describes a method for treating a proliferative skin or eye disease and scarring. The method involves administering a ribozyme (1) which cleaves RNA encoding a cytokine involved in inflammation, matrix metalloproteinase (MPD), cyclin, cell-cycle dependent kinase, growth factor or a reductase, or administering a nucleic acid molecule (II) comprising a promoter operably linked to a cucleic acid segment encoding (1). (1) can have antipsoriatic, anticlaseborrheic, anticlabetic, anticlabetic, anticlabetic, anticlabetic, anticlamentological, cytostatic, antiseborrheic, anticlamenton. (1) can be used in gene therapy. (1) and (II) are useful for treating proliferative skin diseases such as psoriasis, atopic dermatitis, actinic keratosis, squamous or basal cell carcinoma and viral or seborrheic wart. They can also be used for treating proliferative eye diseases such as diabetic retinopathy, vitreoretinopathy, sickle cell retinopathy, retinopathy of prematurity and retinal detachment, and for treating and preventing

```
Kin or eye disease and scarring. The method involves administering a ribozyme (I) which cleaves RNA encoding a cytokine involved in inflammation, matrix metalloproteinase (MMP), cyclin, cell-cycle dependent kinase, growth factor or a reductase, or administering a nucleic acid molecule (II) comprising a promoter operably linked to a nucleic acid molecule (II) comprising a promoter operably linked to a nucleic acid molecule (II) comprising a promoter operably linked to a nucleic acid molecule (II) comprising a promoter operably linked to a nucleic acid molecule (II) comprising a promoter operably linked to a nucleic acid molecule (II) comprising a nutleice activities, and clematological, vulnerary, keratolytic and viruide activities, and cleaves RNA encoding cytokine involved in inflammation. (I) can be used in gene therapy. (I) and (II) are useful for treating proliferative skin diseases such as psoriasis, atopic dermatitis, actinic keratosis, squamous or basal cell carlinoma and viral or sebortheic wart. They can also be used for treating proliferative eye diseases such as diabetic retinopathy, vitreoretinopathy, sickle cell retinopathy, retinopathy of prematurity and retinal detechment, and for treating and preventing scarring such as keloid, adhesion and hypertrophic or hypertrophic burn scar. AAH57577 to AAH62099 represent sequences used in the cemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention describes a method for treating a proliferative
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Example 1; Page 106; 408pp; English.

Cell-cycle dependent kinase cdk3 ribozyme binding site SEQ ID NO:335.

```
The present invention describes a method for treating a proliferative skin or eye disease and scarring. The method involves administering a cribozyme (I) which cleaves RNA encoding a cytckine involved in inflammation, matrix metalloproteinase (MMP), cyclin, cell-cycle dependent kinase, growth factor or a reductase, or administering a nucleic acid molecule (II) comprising a promoter operably linked to a culcie acid segment encoding (I). (I) can have antipsoriatic, antisickling, ophthalmological, cytostatic, antiseborrheic, antidiabetic, antisickling, ophthalmological, vulnerary, keratolytic and virucide activities, and cleaves RNA encoding cytokine involved in inflammation. (I) can be used in gene therapy. (I) and (II) are useful for treating proliferative skin diseases such as psoriasis, atopic dermatitis, actinic keratosis, squamous or basal cell carcinoma and viral or seborrheic wart. They can also be used for treating proliferative eye diseases such as diabetic retinopathy, vitreoretinopathy, sickle cell retinopathy, retinopathy of prematurity and retinal detachment, and for treating and preventing

The present invention describes a method for treating a proliferative skin or eye disease and scarring. The method involves administering a ribozyme (1) which cleaves RNA encoding a cytokine involved in inflammation, matrix metalloproteinase (WMP), cyclin, cell-cycle dependent kinase, growth factor or a reductase, or administering a nucleic acid molecule (II) comprising a promoter operably linked to a concleic acid molecule (II) comprising a promoter operably linked to a cucleic acid molecule (II) comprising a promoter operably linked to a cucleic acid segment encoding (I). (I) can have antipsoriatic, dermatological, cytostatic, antiseborrheic, antidiabetic, antisickling, ophthalmological, vulnerary, keratolytic and virucide activities, and cleaves RNA encoding cytokine involved in inflammation. (I) can be used in gene therapy. (I) and (II) are useful for treating proliferative skin diseases such as psoriasis, atopic dermatitis, actinic keratosis, squamous or basal cell carcinoma and viral or seborrheic wart. They can also be used for treating proliferative eye diseases such as diabetic retinopathy, vitreoretinopathy, sickle cell retinopathy, retinopathy of prematurity and retinial detechment, and for treating and preventing proverting the prematurity and retinial detechment, and for treating and preventing proverting and preventing proverting and preventing and preventing proverting and preventing proverting and preventing proverting and preventing and preventing proverting and preventing preventing and preventing and prevent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                        Treating proliferative skin or eye diseases and scarring, using ribozymes that cleave RNA encoding cytokines involved in inflammation, matrix metalloproteinases, growth factors and cell-cycle dependent kinases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    scarring such as keloid, adhesion and hypertrophic or hypertrophic burn scar.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention relates to antisense oligonuclectides and methods for modulating the expression of human or mouse casein kinase 2-alpha prime. The antisense oligonuclectides are useful for inhibiting the expression of casein kinase 2-alpha prime, and for treating diseases or conditions associated with aberrant expression of casein kinase 2-alpha prime, and for treating diseases or prime. Such diseases include diabetes mellitus, and hyperproliferative disorders (particularly cancers e.g. breast cancer, prostate cancer, or liver cancer). The antisense compounds are also useful for diagnostics, therapeutics, prophylaxis, e.g. to prevent or delay infection, inflammation or tumour formation, as research reagents and kits, and in distinguishing between functions of various members of a biological pathway. The present sequence represents a PCR primer used to amplify DNA encoding human casein kinase 2-alpha prime in the examples of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Chinese hamster; expression augmenting sequence element; EASE; HMG-I(Y); recombinant protein expression; mammalian host cell; PCR; primer; ss; high mobility group; nonhistone chromatin protein; architectural transcription factor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New antisense oligonucleotides targeted to nucleic acid encoding casein kinase 2-alpha prime, useful for diagnosing and/or treating a disease or condition associated with expression of casein kinase 2-alpha prime.

sequences of the invention contain numerous binding sites for members of the HMG-I(Y) ("high mobility group") family of nonhistone chromatin proteins, a group of minor groove-binding architectural transcription factors which are thought to be involved in the mechanisms by which EASE sequences improve expression of transgenes. The EASEs of the invention of transgenes. The EASEs of the invention of transfer and also be used in the identification of additional EASE sequences (e.g. from other transformed cell lines which exhibit high levels of expression not attributable to a high gene copy number). Expression of recombinant in microbial (prokaryotic) cells, since the post-translational modifications found in mammalian cells are more likely to resemble those
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   found in a mammal. The present sequence represents a Chinese hamster high mobility group nonhistone chromatin protein-I(Y) (HMG-I(Y)) PCR primer, used in an example of the invention to clone the Chinese hamster HMG-I(Y)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human; chromosome 1p36-35; chromosome 21q22.1; genetic analysis; genome;
                                                                                                                                                                                                                                                                                                                                                                                                           The invention comprises Chinese hamster expression augmenting sequence elements (EASEs; AAK98343-AAK98344) that can be used to improve expression of recombinant proteins in mammalian host cells. The EASE
                                                                                                                                                                                                                                                                                                       New expression augmenting sequence elements isolated from a Chinese hamster ovary cell line improve expression of recombinant proteins in host mammalian cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö

The present invention describes a method of arraying genome clones. The method comprises: (a) clones of the genomic libraries contained in multiwell plates numbered for discrimination are mixed in each of the multiwell plates; (b) a primer designed based on the chromosome marker sequence is added to the mixture to carry out an amplification reaction; (c) a signal corresponding to the marker is detected from the resultant camplified product to specify the discrimination Nos. of the multiwell plates containing the clones having said marker sequence; (d) the order of the markers is changed so that the same discrimination Nos. succeed to the maximum in the specified discrimination Nos. to array the multiwell plates; (e) the clones in the multiwell plates of the specified discrimination Nos. to array the multiwell and lateral directions; (f) the mixed clones are cultured and the creat data from the amplified by using the above primer; (g) signals and lateral directions; (f) the mixed clones are cultured as the positions on the chromosome and arrayed. The microarray is useful for gene analysis. ABL42957 to ABL45322 represent PCR primers for human chromosome lages. ABL45322 represent PCR primers for human chromosome 21q22.1, which are specifically claimed for use in the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence 19 BP; 5 A; 3 C; 9 G; 2 T; 0 U; 0 Other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention relates to nucleic acid probes, which are useful for assaying nucleic acids by hybridising with a target nucleic acid, in which a single-stranded oligonucleotide is labelled with a fluorescent substance and a quencher in a manner that the fluorescence intensity of the hybridisation reaction system is increased after completion of the hybridisation but no stem loop structure is formed. The probes are useful for assaying nucleic acids and their polymorphism and mutation, particularly useful for e.g. analytical applications, disease diagnosis and microbial identification. The present sequence was used to illustrate

substance and a quencher in a manner that the fluorescence intensity of the hybridisation reaction system is increased after completion of the hybridisation but no stem loop structure is formed. The probes are useful for assaying nucleic acids and their polymorphism and mutation, particularly useful for e.g. analytical applications, disease diagnosis and microbial identification. The present sequence was used to illustrate

The present invention relates to nucleic acid probes, which are useful for assaying nucleic acids by hybridising with a target nucleic acid, in which a single-stranded oligonucleotide is labelled with a fluorescent substance and a quencher in a manner that the fluorescence intensity of the hybridisation reaction system is increased after completion of the hybridisation but no stem loop structure is formed. The probes are useful for assaying nucleic acids and their polymorphism and mutation, particularly useful for e.g. analytical applications, disease diagnosis and microbial identification. The present sequence was used to illustrate the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention describes the use of irinotecan (I) or its derivative for the preparation of a pharmaceutical composition for treating colorectal, cervical, gastric, lung, ovarian or pancreatic cancer, or malignant glioma in a subject having a genome with a variant allele which comprises a cytochrome p450, subfamily IIIA (nifedipine cytostatic applications of (II) and (II) have cytostatic activity. The therapeutic applications of (I) is improved, since it is possible to individually treat a subject with an appropriate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New use of irinotecan for preparation of compositions for treating in subject having genome with variant allele comprising cytochrome subfamily IIIA, polypeptide 5 polynucleotide, termed CYP3A5.
their polymorphism and mutation, particularly useful in science amedicine for e.g. analytical applications, disease diagnosis and microbial identification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Cancer; CYP3AS; irinotecan; pharmaceutical; malignant glioma; cytochrome p450; subfamily IIIA; nifedipine oxidase; polypeptide cytostatic; PCR primer; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                     The present invention relates to nucleic acid probes, which are useful for assaying nucleic acids by hybridising with a target nucleic acid, in which a single-stranded oligonucleotide is labelled with a fluorescent substance and a quencher in a manner that the fluorescence intensity of the hybridisation reaction system is increased after completion of the hybridisation but no stem loop structure is formed. The probes are useful for assaying nucleic acids and their polymorphism and mutation, particularly useful for e.g. analytical applications, disease diagnosis and microbial identification. The present sequence was used to illustrate
                                                                                                                                                                                                                              Fluorescently-labeled nucleic acid probes for assaying nucleic acids and their polymorphism and mutation, particularly useful in science and medicine for e.g. analytical applications, disease diagnosis and microbial identification.

The present invention describes the use of irinotecan (I) or its derivative for the preparation of a pharmaceutical composition for treating colorectal, gastric, lung, ovarian or pancreatic cancer, or malignant gliona in a subject having a genome with a variant alled which comprises a cytochrome p450, subfamily IIIA (nifedipine oxidase), polypeptide 5 (CYP3A5) polymucleotide (II). (I) and (II) have cytostatic activity. The therapeutic applications of (I) is improved, since it is possible to individually treat a subject with an appropriate derivative of (I). Therefore, undesirable, harmful or toxic effects are efficiently avoided. Unnecessary and potentially harmful treatment of those subjects who do not respond to the treatment with substances (nonresponders), as well as the development of drug resistances due to suboptimal drug dosing can be avoided. ACF62200 to ACF62751 and ABM34912 to ABM35013 represent sequences used in the
                                                                                                                                                                                                                                            ö
dosage and/or an appropriate derivative of (I). Therefore, undesirable, harmful or toxic effects are efficiently avoided.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          present sequence represents
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              treating colorectal, cervical, gastric, lung, ovarian or pancreatic cancer, or malignant glioma in a subject, where the subject is a human (preferably African or Asian) or a mouse. The present sequence represents a sequence which is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention describes a method for the use of irinotecan (I) cits derivative for the preparation of a pharmaceutical composition for treating colorectal, cervical, gastric, lung, ovarian or pancreatic cancer, or malignant glioma in a subject having a genome with a variant allele which comprises a multidrug resistance protein 1 (MRP1) polynucleotide (II). (I) has cytostatic activity. (I) or its derivative can be used for the preparation of a pharmaceutical composition for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     g
                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention describes a method for the use of irinotecan (I) or its derivative for the preparation of a pharmaceutical composition for treating colorectal, cervical, gastric, lung, ovarian or pancreatic cancer, or malignant glioma in a subject having a genome with a variant allele which comprises a multidrug resistance protein 1 (MRP1) polynucleotide (II). (I) has cytostatic activity. (I) or its derivative can be used for the preparation of a pharmaceutical composition for treating colorectal, cervical, gastric, lung, ovarian or pancreatic cancer, or malignant glioma in a subject, where the subject is a human (preferably African or Asian) or a mouse. The present sequence represents a sequence which is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
